

Internet Of Things

# Serial Communication

Let's talk to your Arduino

# Serial Communication

- ❖ The word **serial** means "one after the other". Serial data transfer is when we transfer data one bit at a time, one right after the other.
- ❖ Serial is used for communication between Arduino board and a computer or other devices. All Arduino boards have at least 1 serial port, also known as **UART** (universal asynchronous receiver /transmitter).
- ❖ It communicates on digital pins **0 (RX)** and **1 (TX)** as well as with the computer via USB. Thus, if you use these functions, you cannot also use pins 0 and 1 for digital input or output.

# Baud Rate

- ❖ The baud rate specifies **how fast data is sent over a serial line**, expressed in units of bits per second (bps).
- ❖ Baud rates can be any value, the only requirement is that **both devices operate at the same rate**. One of the more common baud rates is 9600 bps. Other standard baud rates are 1200, 2400, 4800, 19200, 38400, 57600 and 115200.
- ❖ **The higher a baud rate goes, the faster data is sent/received**, but there are limits to how fast data can be transferred. Get too high, and you'll begin to see errors on the receiving end.

# A little note

A single bit is either a 0 or a 1

8 bits = 1 Byte

1 KB = 1024 Bytes = 8192 bits

1024 KB = 1048576 bytes = 1 MB

1024 MB = 1 GB

# Serial Communication With Arduino IDE

1. Initiate: `Serial.begin(baudrate);`
2. Execute: `Serial.print(x);`
3. See the result on serial monitor

# Hello World on Setup

```
void setup() {  
    Serial.begin(9600);  
    Serial.print("Hello World!");  
    //tulis "Hello World!"  
}  
  
void loop() {  
}
```

# Hello World on Loop

```
void setup() {  
  Serial.begin(9600);  
}
```

```
void loop() {  
  Serial.println("Hello World!");  
  delay(1000);  
  //tulis "Hello World!" tiap 1 detik  
}
```

# Constant & Variable

3 nanas

6 x = 12

# Arduino Data Type

Datatype	Minimum Value	Maximum Value
unsigned char	0	255
signed char	-128	127
unsigned short int	0	65535
signed short int	-32768	32767
unsigned int	0	65535
signed int	-32768	32767
unsigned long int	0	4294967295
signed long int	-2147483648	2147483647
float	$3.4 \times 10^{-38}$	$3.4 \times 10^{38}$
double	$1.7 \times 10^{-308}$	$1.7 \times 10^{308}$
long double	$3.4 \times 10^{-4932}$	$1.1 \times 10^{-4932}$
enum	-32768	32767

# Integer & Float

```
int x = 2;           // x integer = 2
float y = 0.6789     // y float = 0.6789

void setup() {
    Serial.begin(9600);
}

void loop() {
    Serial.println(x);    // output = 2
    Serial.println(y);    // out= 0.67
    Serial.println(y,4);  // out= 0.6789
    delay(1000);
}
```

# Character & String

```
char x = 'a';  
String y = "Hello World!"
```

```
void setup() {  
    Serial.begin(9600);  
}
```

```
void loop() {  
    Serial.println(x); // output = a  
    Serial.println(y); // Hello World!  
    delay(1000);  
}
```

# Arithmetic \* / + - %

```
int a = 4; int b = 2;
```

```
void setup() {  
  Serial.begin(9600);}
```

```
void loop() {  
  Serial.println(a * b); // = 8  
  Serial.println(a / b); // = 2  
  Serial.println(a + b); // = 6  
  Serial.println(a - b); // = 2  
  Serial.println(a % b); // sisa = 0  
  delay(1000);}
```

# Arithmetic $x^2$ $\sqrt{x}$

```
int a = 4; int b = 2;
```

```
void setup() {  
  Serial.begin(9600);}
```

```
void loop() {  
  Serial.println(pow(a,b)); // = 16  
  Serial.println(sqrt(a)); // = 2  
  delay(1000);}
```

# Solve It!

$$\sqrt[3]{8} = ?$$

**Solved!**  $\sqrt[3]{8} = 8^{1/3} = 2$

```
float x = pow(8,0.3333) // 8^0.3333
```

```
void setup() {  
  Serial.begin(9600);}
```

```
void loop() {  
  Serial.println(x); // 8^0.3333=2.00  
}
```

# Basic Iteration

```
int a = 0; int b = 1000;

void setup() {Serial.begin(9600);}

void loop() {
    Serial.print(a++);    // +1 per sec
    Serial.print(" / ");
    Serial.print(b--);    // -1 per sec
    Serial.print(" / ");
    Serial.print(a+=10);  // a=a+10
    Serial.print(" / ");
    Serial.print(b-=10);  // b=b-10
    delay(1000);}
}
```

# For Loop Iteration

```
void setup() {  
    Serial.begin(9600);  
  
    for (int i = 0; i < 10; i++) {  
        Serial.print("i = ");  
        Serial.println(i);  
    }  
}  
  
void loop() {  
}
```

# For Loop Iteration

parenthesis

declare variable (optional)

initialize

test

increment or  
decrement

```
for(int x = 0; x < 100; x++) {  
    println(x); // prints 0 to 99  
}
```

# While Iteration

```
void setup() {  
    int x = 0;  
    Serial.begin(9600);  
  
    while (x < 25) {  
        x = x + 1;  
        Serial.println(x);  
        delay(1000);  
    }  
  
    void loop() {  
    }
```

# Statement If (cond) {prog}

```
void setup() {  
    Serial.begin(9600);  
  
    void loop() {  
        char input;  
  
        if (Serial.available() > 0) {  
            input = Serial.read();  
            Serial.print("Anda mengetik: ");  
            Serial.println(input);  
        }  
    }  
}
```

# if(){} else if(){} else{}

```
void setup() {  
  Serial.begin(9600);}
```

```
void loop() {  
  char input;  
  if (Serial.available() > 0) {  
    input = Serial.read();  
    if (input == '1')  
      {Serial.println("Satu");}  
    else if (input == '2' )  
      {Serial.println("Dua");}  
    else {Serial.println("Lainnya");}  
  }  
}
```

# Blinking LED on board

```
void setup() {  
    pinMode(13, OUTPUT);  
}  
  
void loop() {  
    digitalWrite(13, HIGH);  
    delay(1000);  
    digitalWrite(13, LOW);  
    delay(1000);  
}
```

# Control LED via Serial Monitor

```
void setup() {  
    Serial.begin(9600);  
    pinMode(13, OUTPUT);  
  
    void loop() {  
        char input;  
        if (Serial.available() > 0) {  
            input = Serial.read();  
            if (input == 'a') {  
                digitalWrite(13, HIGH);  
            }  
            if (input == 'b') {  
                digitalWrite(13, LOW);  
            }  
        }  
    }  
}
```

# OR || & AND &&

```
void setup() {  
    Serial.begin(9600);  
    pinMode(13, OUTPUT);}
```

```
void loop() {  
    char input;  
    if (Serial.available() > 0) {  
        input = Serial.read();  
        if (input == 'a' || input == 'A')  
            {digitalWrite(13, HIGH);}  
        if (input == 'b' || input == 'B')  
            {digitalWrite(13, LOW);}  
    }  
}
```
